Heat transfer refers to the movement of thermal energy from one physical body or region to another due to a temperature difference. It occurs through three primary mechanisms:

- Conduction:** Transfer of heat through a solid material without any bulk movement of the material itself.
- Convection:** Transfer of heat between a solid surface and a moving fluid (liquid or gas).
- Radiation:** Transfer of heat through electromagnetic waves, capable of occurring through a vacuum.

Senthil's teachings emphasize the significance of understanding each mode, their governing laws (such as Fourier's law for conduction and Newton's law of cooling for convection), and their practical applications.

What is Mass Transfer?

Mass transfer involves the movement of mass from one location to another, often due to concentration gradients. It is essential in processes like distillation, absorption, drying, and chemical reactions. Key mechanisms include:

- Diffusion:** Movement of molecules from high to low concentration regions, described by Fick's laws.
- Convection:** Similar to heat transfer, where mass is transferred via bulk fluid motion.
