Sample Question and Answer from a Diploma Electronics Communication Paper

Question: Explain the principle of amplitude modulation (AM) and derive the expression for an AM wave.

Answer: Amplitude modulation (AM) is a modulation technique where the amplitude of a high-frequency carrier wave is varied in proportion to the instantaneous amplitude of the message signal (modulating signal). This method enables the transmission of audio, video, or data signals over communication channels.

Principle of AM: The message signal ($m(t)$) contains the information to be transmitted. A high-frequency carrier wave ($c(t)$) is modulated by $m(t)$. The resulting AM wave contains the carrier frequency along with sidebands that carry the information.

Mathematical Expression: Let the message signal be $m(t)$, and the carrier wave be:

$$c(t) = A_c \cos(\omega_c t)$$

where: A_c = amplitude of the carrier, ω_c = angular frequency of the carrier

The modulated wave (AM wave) is given by:

$$s(t) = [A_c + m(t)] \cos(\omega_c t)$$

Assuming: $m(t) = A_m \cos(\omega_m t)$ where: A_m = amplitude of message signal, ω_m = angular frequency of message signal

Then: $s(t) = [A_c + A_m \cos(\omega_m t)] \cos(\omega_c t)$

Using the trigonometric identity: $\cos A \cos B = \frac{1}{2} [\cos(A + B) + \cos(A - B)]$

Expanding, we get: $s(t) = A_c \cos(\omega_c t) + A_m \cos(\omega_m t) \cos(\omega_c t)$

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$
 Final Expression:

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$
 This expression shows the carrier frequency component and the two sidebands which contain the information. The process of demodulation involves extracting the message signal from this AM wave.

Conclusion A well-structured diploma electronics communication question paper with answers is an invaluable tool for students aiming to excel in their exams. By understanding the exam pattern, practicing previous question papers, and thoroughly reviewing answers, students can build confidence and improve their problem-solving skills. Focused preparation on core topics such as analog and digital communication, transmission media, and modulation techniques will ensure comprehensive readiness. 1. Analog Modulation Techniques Understanding modulation is fundamental in communication systems. Questions often cover:

- Amplitude Modulation (AM)
- Frequency Modulation (FM)
- Phase Modulation (PM)

Sample Question & Answer:
Q: Explain the principle of amplitude modulation and derive the expression for the modulated wave.
 Answer: Amplitude modulation involves varying the amplitude of

the carrier wave in proportion to the message signal. If the message signal is $m(t)$ and the carrier wave is $c(t) = A_c \cos(2\pi f_c t)$, then the modulated wave $s(t)$ can be expressed as: $s(t) = [A_c + m(t)] \cos(2\pi f_c t)$ For a message signal $m(t) = A_m \cos(2\pi f_m t)$, the modulated wave becomes: $s(t) = A_c \cos(2\pi f_c t) + A_m \cos(2\pi f_m t) \cos(2\pi f_c t)$ Using the trigonometric identity: $\cos A \cos B = \frac{1}{2} [\cos(A + B) + \cos(A - B)]$ we get: $s(t) = A_c \cos(2\pi f_c t) + \frac{A_m}{2} [\cos 2\pi (f_c + f_m) t + \cos 2\pi (f_c - f_m) t]$ This reveals that the spectrum contains a carrier and two sidebands, crucial for demodulation.

Problem: Calculate the bandwidth of an AM signal with a message frequency of 5 kHz. Answer: The bandwidth (BW) of an AM signal is twice the maximum frequency of the message signal: $[BW = 2 \times f_m = 2 \times 5, \text{ kHz}] = 10, \text{ kHz}]$ This simple calculation illustrates the

importance of knowing the message frequency for bandwidth estimation. Advantages of Using Diploma Electronics Communication Question Paper with Answer in Exam Preparation
