Fundamental Principles in Physical Hydrology Hendriks

Hendriks? methodology is rooted in classical physics, applying laws such as Darcy's law and conservation of mass to describe water flow.

Darcy's Law This fundamental principle states that the flow rate of water through a porous medium is proportional to the hydraulic gradient and the medium's permeability:

$$Q = -K A \frac{dh}{dl}$$

Where:

- K = hydraulic conductivity
- A = cross-sectional area
- $\frac{dh}{dl}$ = hydraulic gradient

Hendriks refined the application of Darcy's law in heterogeneous soils, accounting for variable permeability.

Water Balance Equation The water balance is expressed as:

$$\frac{\partial \theta}{\partial t} = I - O$$

Where:

- θ = volumetric water content
- I = inflow (precipitation, recharge)
- O = outflow (evapotranspiration, runoff, percolation)

Hendriks integrated these principles into models that simulate temporal and spatial water movement.
